**EOLFI strengthened his partnership with the Brittany Region  
in floating offshore wind power**

**On Tuesday July 11 2017, EOLFI, developer of the floating wind turbines pilot farm project in Groix and Belle-Île, and the Brittany Regional Council, announced they would strengthen their partnership in the interest of MRE (Marine Renewable Energies). Loïg Chesnais-Girard, president of the Region, and Nicolas Paul-Dauphin, EOLFI CEO, stated their joint intention to deepen and structure the necessary conditions to the success of the future developments in the Brittany floating wind energy department. This success will namely rely on the outcomes of the implementation of Groix and Belle-Île's pilot project. In this occasion, EOLFI inaugurates its new facility in Lorient in the presence of Norbert Métairie, Lorient agglomeration president.**

Since 2008, Lorient agglomeration and Brittany region capitalized on the floating wind turbines industry, in particular on the pilot project off the Groix and Belle-Île islands, to initiate an industrial and commercial development in this encouraging sector. This impetus was initiated with Naval Energies (previous DCNS Energies) and General Electric. It was achieved in July 2016, when EOLFI – the French leading SME in this sector – and CGN EE won a supply bid launched by ADEME (French Agency for Environment and Energy Management), for the development of a floating wind turbines pilot farm. This project was financed by regional funds for innovations. It was also endorsed by the Caisse des Dépôts and Meridiam (a French investment fund dedicated to infrastructures).

EOLFI's team will be in charge of projects development on the Atlantic coast.

Recognizing a need for leadership in this rising market, the Brittany regional Council and EOLFI asserted today their willingness to work together. Both stakeholders aim at anticipating the rise of the sector, mostly characterized by the commercial farms development. This strong partnership, based on a sharing of experience and on a common work on the pilot project, will help the best conditions to establish floating wind turbines farms of great capacities in the region, as part of the upcoming national planning. In addition, while this alliance will help fostering reflections on the optimization of regional industrial investments, it will also allow for a better organization of the future commercial projects on the French Atlantic side and abroad.

To support this approach, the Brittany Region will use the investment fund for MRE which is currently being set up and which will help companies that will contribute to these studies.
